"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Tchvete Dimitrova

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Mary Kanack

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Margarita Gil

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem: TOO MUCH HARM IS ALREADY AT HAND.

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❓

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❓ WE HAVE DEFILED OUR OWN SURVIVAL AND FURTHER ACTIONS ARE INSANE.

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❓

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❓ REPEATED SPILLS HAVE SHOWN THE RISKS TAKEN.

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. HOW MUCH FURTHER DAMAGE WILL YOU SUPPORT? If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round. IS THIS WORTH THE INEVITABLE DAMAGE?

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please REJECT the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems. MOVING FORWARD WILL COMPROMISE AND DESTROY OUR BIODIVERSITY BALANCE.

Thank you for considering my comments.

Sincerely,

Gail Barton

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

margo wyse

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Luanne Stone

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Migdalia Rivera

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Judith Galterio

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Sue Busch

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

James Evans

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Sandra Collier

Los Angeles, CA 90020

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Alice West

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

Another Human-centric Capitalist bottom line project that does not care @ all about destroying the entire planet

Dude - this line of action will not stop with salmon and Orcas - it will continue and destroy the human species as well

Just back off

Thank you for considering my comments.

Sincerely,

Ray Iasiello

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

TAMI BRODY

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kara Rea

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Marie Hailey

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kristi Tustin

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Morgan Cormia

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Sabrina Carey

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Taumi Conohan

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Karen Laudadio

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Joanne Smyth

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Maryann Staron

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Krissa Cumpston

Saint Paul, MN 55104

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Suky Punyer

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

karen cashley

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "To the Impact Assessment Agency of Canada:

Please advise the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

We must start acting with long term likely effects of human actions on the environment and living creatures in mind.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences.."

There is no evidence to demonstrate that much of the potential serious damage could be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a important to the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for consideration.

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Patricia Currey

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Cate Harrison

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project would have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank." Well, OBVIOUSLY.

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for such vulnerable species as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise and reduced availability of Chinook salmon, which are the whales' main source of food.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the survival of humankind,

and the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU container ships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, to the integrity of the Salish Sea's biodiversity and ecosystems and to humanity's survival.

Thank you for your time and attention.

Yours truly,

Dana Bellwether

Santa Rosa, CA 95404"

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Marian Frobe

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Linda Roe

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Graham Cleeton

The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Cecilia Carreon

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

"To the Impact Assessment Agency of Canada:

Please take a moment ...

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."²

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."²

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."²

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."²

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Tami Popp

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Ana Talbot Meling

Bremnes, 5430

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

simone maes

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Laura Marinelli

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Edward Johnson

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Matt Zolnay

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Harry Gedney

Concord, NC 280277637

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Evan Throop

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Judith Zwarun

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Marie Freeman

"To the Impact Assessment Agency of Canada:

I encourage the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The findings in the Federal Review Panel Report for the Roberts Bank Terminal 2 Project were clear that this project will have deeply harmful impacts on critical wildlife habitat and the Salish Sea ecosystem. As examples:

"...The Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"...Significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"...Adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

As the joint review panel found in its final report, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The project would also have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

Further, the Fraser River Estuary, which has global significance and serves as a crucial stopover on migration routes stretching between South America, would suffer impacts from this project and increase the threats to shorebirds generally, and western sandpipers specifically.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

Yearly transits from Roberts Bank Terminal 2 would accelerate current climate and biodiversity crises.

Please demonstrate your leadership and commitment to recovery and conservation of Canada's endangered and iconic wildlife species and reject the proposed Roberts Bank Terminal 2 project. Preserve Canada's Wild Salmon Policy, and the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments. May you and yours be well.

Sincerely,

Tracy Heart

Portland, OR 97219-7732

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Daniel Brant

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

ValÃ©rie Paillard

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Mona Spangler

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Joyce St John

San Antonio,, TX 78250

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Barbara Durrell

Des Moines, IA 503103858

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Harold Stanlick

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Christine Anne Montourcy

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. "There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Katarina Grabowsky

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Katherine Sampson

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Elizabeth MacKelvie

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Benjamin Waller

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kellilee Williams

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Jim Derzon

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Louise Ashleson

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Sheran Powers

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Grace Fedele

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Tania Leontov

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Susana Mirazon

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Judy Martinez

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

h silkin

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Ken Zamvil

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kathleen Panarisi

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kathy Ratcliff

Franklin, NC 287349780

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Sue Awezec

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and

biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Jan Hughes

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Maria Elena Molina

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

jan stalnaker

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Christopher Lepple

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."❏

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."❏

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."❏

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."❏

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs.
