"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Stephanie Vasquez

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally, and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Cordelia Baethge

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Caroline James

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Jenny Heinz

New York, NY 10024

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

(2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

teresa mcclure

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Karen Brick

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Robert Schaffer

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Edward Spevak

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Evan Garvey

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Joanne Bergen

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Janet Swihart

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Alice van Buren

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Laurie Gorman

Visalia, CA 93277

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

G. Randy Keller

Houston, TX 77024

"To Impact Assessment Agency of Canada:

I am writing to express my strong opposition to the proposed Roberts Bank Terminal 2 project. Please REJECT this dangerous plan

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have extremely detrimental impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Victor Castellanos

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Marci Barfknecht

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Joe Roy

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Patricia Plunkett

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kevin Bickers

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Meg Casey

Edmonds, WA 98020

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Peter Nielsen

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Joyce Devlin

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Steve Nieves

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

George O'Brien

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Dale Ryon

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Beth Thacker

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Benita Moore

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Alezz Laielen

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Shea Rowan

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Paul Kripli

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Melanie Tapelt

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Zilia Balkansky-Selles

Bloomington, IN 47408

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Angela Shepperdson

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Kara Huberman

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Elaina Hatsis

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Katherine Bedaywi

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. "The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Evelyn Miller

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

John Beamer

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Josh Fox

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Lauri Rudolph

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Alanna Zrimsek

San Francisco, CA 94109

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Laurie Black

Seattle, WA 98102

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Dallas Windham

Irving, TX 750386296

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

E. Singh

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. "The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Tisa Lynch

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Nasir Masood

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Lisa Ebeler

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

kathy beeney

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Amy Cannata

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

We must protect marine life from the greed and carelessness of big business. We don't need any more cruise ships and their terminals polluting our oceans and destroying what is left of our marine heritage. Once these animals are gone, they're gone. How do we honestly justify that? There is no Plan(et) B!

Thank you for considering my comments.

If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Shari Alpern

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).

The loss of critical habitat in the Fraser River Estuary and the additional 520 container ship transits per year from Roberts Bank Terminal 2 will only serve to further accelerate the current climate and biodiversity crises. If the recovery and conservation of Canada's endangered and iconic wildlife species are a priority for the Government of Canada, then this project must be rejected.

If the federal government of Canada approves the proposed Roberts Bank Terminal 2 project, the conditions need to include requirements for emergency response vessels with firefighting capabilities and Emergency Towing Vessels to be on stand-by year-round.

The 2021 fire aboard the Zim Kingston was contained by two tugs with firefighting capabilities that just happened to be at a nearby dock. A large-scale environmental disaster was averted. The Zim Kingston is a 4,253 TEU container ship. As proposed, 24,000 TEU container ships would call on Roberts Bank Terminal 2. Emergency response vessels with firefighting capabilities for 24,000 TEU containerships are an essential condition.

Container ships carry large volumes of propulsion fuel that could cause a catastrophic oil spill if an accident occurs. In order to prevent accidents and oil spills, Emergency Towing Vessels capable of effectively responding to 24,000 TEU container ships in distress are needed along the project's vessel traffic route through the Salish Sea.

Please reject the proposed Roberts Bank Terminal 2 and demonstrate a commitment to Canada's Species at Risk Act and Canada's Wild Salmon Policy, and to the integrity of the Salish Sea's biodiversity and ecosystems.

Thank you for considering my comments.

Sincerely,

Bridget Wyatt

"To the Impact Assessment Agency of Canada:

I urge the federal government of Canada to reject the proposed Roberts Bank Terminal 2 project.

The Federal Review Panel Report for the Roberts Bank Terminal 2 Project was clear in its findings that this project will have devastating impacts on critical wildlife habitat and the Salish Sea ecosystem:

"The Panel concludes that the Project would result in numerous adverse residual and cumulative effects. The proposed offsetting plan for aquatic species, totaling 29 hectares, would be insufficient to compensate for the reduction in productivity associated with a Project-induced habitat loss of 177 hectares of Roberts Bank."

"There would be significant adverse and cumulative effects on Dungeness crab as well as ocean-type juvenile Chinook salmon originating from the Lower Fraser and South Thompson Rivers."

"The Project would cause significant adverse and cumulative effects on SRKW [Southern Resident killer whales] ... a lethal vessel strike on a single individual SRKW could have significant adverse population consequences."

"If a worst-case oil spill were to occur in the marine shipping area, it could result in potentially significant adverse residual effects for vulnerable species such as SRKW and marine birds, marine commercial and recreational activities, current use, cultural heritage, and health of Indigenous groups."

As the joint review panel found in its final report on the project, Roberts Bank T2 would have significant adverse effects on Chinook by disrupting their migration and impacting underwater light and acoustics. The panel also found the project would have significant adverse and cumulative effects on the Southern Residents through habitat loss, an increase in underwater noise, and reduced availability of Chinook salmon, which are the whales' main source of prey.

In addition, the Fraser River Estuary has global significance and serves as a crucial stopover on migration routes stretching between South America and the high Arctic. Environment Canada concluded that the impacts from this project would increase the threats to shorebirds generally and western sandpipers specifically, and that these risks cannot be mitigated.

There is no evidence that demonstrates that any of the above damage can be offset with mitigation strategies. Habitat mitigation and habitat offsetting are not effective in addressing the negative effects from terminal projects (Lievesley et al. (2016) found that only 33% of the Port of Vancouver's own habitat offsetting projects obtained their intended goals, and the Canada-wide study by Quigley and Harper (2006) determined that 50% of fish habitat mitigation projects were not compensating for damages on a 1:1 ratio).
