ANNEX 1: Advice to the Agency

Table 1: Please use the table below to provide advice for the Agency's consideration in its recommendation to the Minister of Environment and Climate Change and preparation of draft conditions

Qu	estions	Responses/Comments
•	Has the proponent described all project components and activities in sufficient detail to understand all relevant project-environment interactions? If not, identify what additional information is needed.	
•	Were the study areas sufficient to predict potential effects from all relevant project- environment interactions, and to consider the effects within a local and regional context? Is the baseline information sufficient to characterize the existing environment, predict potential effects and obtain monitoring objectives? If not, identify what additional information is needed.	
	Alternatives Assessment	
•	Has the proponent adequately described the criteria it used to determine the technically and economically feasible alternative means? Has the proponent listed the potential effects to valued components (VCs) within your mandate that could be affected by the technically and economically feasible alternative means?	
•	Has the proponent adequately described why it chose each preferred alternative means? Are there other alternative means that could have been presented? If so, please describe.	
	Environmental Effects Assessment	
•	Has the proponent clearly described all relevant pathways of effects to be taken into account under section 5 of CEAA 2012? Has the proponent identified all potential effects to VCs, including species at risk, within your mandate? Were all potential receptors considered?	
•	Were the methodologies used by the proponent appropriate to collect baseline data and predict effects, why or why not?	
•	Has the proponent explicitly addressed the degree of scientific uncertainty related to the data and methods used within the assessment? If there are unaccounted for scientific uncertainties, describe them and indicate the options for increasing certainty in the predictions?	

Questions	Responses/Comments
• Are the predicted effects described in objective and reasonable terms (e.g. beneficial or adverse, temporary or permanent, reversible or irreversible)?	
• Has the proponent adequately assessed the potential cumulative environmental effects, including using appropriate temporal and spatial boundaries, examining physical activities that have been and will be carried out, and proposing mitigation and follow-up program requirements? Provide rationale.	
• Has the proponent adequately described the potential for environmental effects caused by accidents and malfunctions, including the types of accidents and malfunctions, their likelihood and severity and the associated potential environmental effects? If not, identify what additional information is needed.	
 Are you satisfied with the proponent's assessment of effects of the environment on the Project? Has the proponent characterized the likelihood and severity appropriately? Provide rationale. 	
 Has the proponent sufficiently described and characterized the project activities and components as they relate to federal decisions within your mandate? If not, identify what additional information is needed. 	
 Are changes to the environment, as they relate to federal decisions within your mandate, sufficiently described? If not, identify what additional information is needed. 	
Mitigation	
• Has the degree of uncertainty regarding the effectiveness of the proposed mitigation measures been described? If not, identify what information is needed.	
• Is it clear how each proposed mitigation measure links to each potential pathway of effect?	
• Would you propose different or additional mitigation measures? If so, provide a description of the mitigation measure(s), with rationale.	
• Which of the proposed mitigation measures and/or project design elements do you consider to be necessary to reduce the likelihood of significant adverse environmental effects? Provide rationale.	
Residual Adverse Environmental Effects	
• Are the identification and documentation of residual environmental effects described by the proponent adequate? If not, what are the aspects for which there is uncertainty and, where	

Questions	Responses/Comments
possible, indicate how these residual effects can be best described. If there is uncertainty, what are the options for increasing certainty?	
• Did the proponent provide a sufficiently precise, ideally quantitative, description of the residual environmental effects related to your mandate? Identify any areas that are insufficient.	
Determination of Significance	
• Are the conclusions on significance in the EIS supported by the analysis that is provided?	
• Are the proponent's proposed criteria for assessing significance appropriate? This includes how	
the criteria were characterized, ranked, and weighted. Provide rationale. Where the proponent	
has not used one of the Agency's recommended key criteria (magnitude, geographic extent,	
duration, frequency, reversibility, and social/ecological context), has a rationale been provided?	
Were appropriate methodologies used in developing the conclusions on significance?	
• Do you agree with the proponent's analysis and conclusions on significance? Provide rationale.	
Monitoring and Follow-up	•
Does the proposed monitoring and follow-up program verify the predictions of the	
environmental assessment as they relate to section 5? Please explain additional monitoring or	
follow-up needed to address uncertainty in the effects assessment.	
• Does the proposed monitoring and follow-up program verify the effectiveness of proposed	
mitigations as they relate to section 5? Please explain additional monitoring or follow-up	
needed to address uncertainty in the proposed mitigation.	
• Is the objective of the follow-up program clear and measurable?	
• Does the follow-up program include sufficient detail, and technical merit, for the Agency to	
achieve the stated objective through a condition (e.g. sufficient baseline dataset, monitoring	
plans, acceptable thresholds of change, contingency procedures)?	
• Are you aware of any federal or provincial authorizations or regulations that will achieve the	
same follow-up program objective(s)? If so, how do these achieve the objective(s)?	
Additional comments, views, advice	
Provide any other comments.	

ANNEX 2: Information requirements directed to the proponent

Table 2: Please use the table below to provide your department's comments and suggestions for information that should be required from the proponent to ensure the information in the EIS is scientifically and technically accurate and is sufficient to make a determination of significance on environmental effects.

ID	Project Effects Link to CEAA 2012	Reference to EIS guidelines	Reference to EIS	Context and Rationale	Specific Question/ Request for Information
ECCC- 01	5(1)(a)(iii) Migratory Birds	2.2 - Alternative Means of Carrying out the Project	2.10.2.5 - Offshore Vessel Lighting (including Flaring)	Quote (page 45) "The MODU used for the Project will be an existing drilling unit contracted through a third-party drilling contractor and selected based on technical capabilities as well as safety considerations. Suncor is not aware of any operating MODUs currently equipped with spectral modified lighting that have the technical capability to support the Project". The proponent has included "standard MODU lighting" and "spectral modified lighting" in the alternatives analysis, and indicated that "spectral	ECCC requests that the proponent undertake a more thorough and complete analysis of alternative means of lighting and flaring, with consideration of the draft recommendations made in the <i>Regional</i> <i>Assessment of</i> <i>Offshore Exploratory</i> <i>Drilling East of</i> <i>Newfoundland and</i> <i>Labrador draft</i> report.

modified lighting" is not
feasible.
ECCC disagrees that the
proponent has conducted
a sufficient analysis of
alternative means for
lighting.
ECCC also notes that the
Regulation Respecting
Excluded Physical
Activities (Newfoundland
and Labrador Offshore
Exploratory Wells) s.21
includes measures that
proponents should
implement to avoid
harming, killing or
disturbing migratory birds
including:
e) controlling lighting
required during the
carrying out of the
activity, including its
direction, timing,
intensity and glare;
h) documenting any
changes made to lighting
regimes to allow for an
evaluation of the
effectiveness of the
change in mitigating light
attraction;

				 i) a research program to identify changes in light spectrum, type or intensity that may further reduce attraction for storm petrels and other migratory seabirds; i) incorporating any technology that becomes available into migratory seabird monitoring to complement research on the mitigation of light attraction. 	
ECCC-02	5(1)(a)(iii) Migratory Birds	2.2 - Alternative Means of Carrying out the Project	2.4.3 - Well Evaluation and Testing 2.10.2.6 - Flaring and Alternative Testing Methods	Quote (2-13) "Seawater is sprayed through a series of high-pressure nozzles during a DST to dissipate heat between the flare and the MODU. This seawater curtain is likely to deter birds near the flare" Quote (page 2-43) "Flaring, if required, is expected to be brief and intermittent in nature (lasting up to 36 hours at a time) and could occur several times in the well flow test period, which in total is expected to last one month. If Suncor intends to flare, it will notify the CNLOPB in	ECCC requests that the following key mitigation measures be included for consideration in the EIS and that all corresponding sections and tables be updated accordingly: • When flaring occurs, a trained seabird observer will monitor and document bird behaviour around the flare to assess the effectiveness of flare shields

		accordance with	and water
		"Measures to Protect and	curtains in
		Monitor Seabirds in	mitigating flare-
		Petroleum-related Activity	bird interactions,
		in the Canada-	as applicable.
		Newfoundland and	
		Labrador Offshore Area"	
		(CNLOPB, n.d.). Suncor	ECCC requests that
		will use a water curtain to	systematic stranded
		protect personnel and	bird surveys be
		equipment on the MODU	conducted before and
		by limiting the transfer of radiated heat from the	after flaring activities
		flare, thereby mitigating	to assess the impacts
		the risk of fire. A	of flaring on migratory
		secondary benefit of a	birds.
		water curtain may be	
		potential deterrence of	
		birds in the general	
		vicinity of the flare based	
		on the positioning of the	
		water curtain. A water	
		curtain could be	
		considered a technically	
		and economically feasible	
		option as a flare shield to	
		reduce adverse effects of	
		flaring on birds."	
		Uncertainty remains	
		regarding the	
		effectiveness of water	
		curtains in deterring birds	
		near the flare.	
		Additionally, the	
		Regulation Respecting	
		Excluded Physical	
		Activities (Newfoundland	
		and Labrador Offshore	

				Exploratory Wells) s.21 includes measures that proponents should implement to avoid harming, killing or disturbing migratory birds including: k. having a [trained seabird observer] monitor and document migratory bird behaviour around the flare while flaring occurs and assess the effectiveness of water curtains and flare shields in mitigating interactions between migratory birds and flares. Daily systematic stranded bird surveys should be conducted on decks before and after flaring activities to assess the impacts of flaring on migratory birds.	
ECCC-03	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitats	6.2.2 - Seabirds Tables 6.8 and 6.9	General Comment on Section 6.2 The current colony size estimates are out of date and can be updated, but will not change the overall content of the EIS. More recent information on colony size estimates is available from ECCC upon request.	ECCC advises the proponent that updated colony size estimates are available upon request.

ECCC-04	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory	6.2.2 - Seabirds	Table 6.9 lists 15 major	ECCC requests that
		birds and their	Table 6.9	marine bird colonies, but	the proponent revise
		habitats		ECCC notes that this list is	Table 6.9 to include
				not comprehensive and	Little Fogo Islands and

				minimum. Additionally,	

ECCC-05	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory	6.2.2.7 - Storm-Petrels	the proponent should contact ECCC-CWS to obtain any missing information and/or data that is needed to revise the table. Quote (page 6-87) <i>"The</i>	ECCC requests that
		birds and their habitat		nesting distribution of the Leach's Storm-petrel on the Atlantic Ocean includes Atlantic Canada (Nova Scotia, New Brunswick and Newfoundland), Iceland, Scotland and Norway" The Atlantic distribution of Leach's Storm-petrels is much broader than is described in the statement above, including other parts of Canada (i.e., Quebec, Labrador), the United States of America (i.e., Maine), France (i.e., Saint Pierre et Miquelon), and many other European countries (beyond Norway). ECCC recommends that the proponent consult Pollet et al. 2019 to obtain more accurate	the proponent revise the statement, provided in the previous column, to reflect the full distribution of nesting Leach's Storm-petrel in the Atlantic Basin, with specific reference to Pollet et al. 2019.

ECCC-06	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitat	6.2.2.7 - Storm-petrels	information on the full distribution of nesting Leach's Storm-petrel across the Atlantic Basin. Pollet, I.L., Bond, A.L., Hedd, A., Huntington, C.E., Butler, R.G., and Mauck, R. (2019). Leach's Storm-Petrel (<i>Oceanodroma</i> <i>leucorhoa</i>), version 2.0. In The Birds of North American (P.G. Rodewald, Editor). Cornell Lab of Ornithology, Ithaca, NY, USA. <u>https://doi.org/10.2173/b</u> <u>na.llcspet.02</u> Quote (page 6-90) <i>"It is</i> <i>likely that millions of</i> <i>storm-petrels use the RAA</i> <i>during the April-October</i> <i>period. Tracking studies</i> <i>show an increased</i> <i>presence of Leach's</i> <i>storm-petrels in the</i> <i>Project Area as they begin</i>	ECCC requests that the proponent provide an additional statement to reflect the likely increased presence of Leach's Storm-petrel in the Project Area in September and
				-	-
				et al. 2014b)The species was not recorded on the	

				ECSAS surveys in the Project Area during the December-March period" Leach's Storm-petrel strandings peak on offshore installations in September and October, the timing of which coincides with the fledging period of this species.	
ECCC-07	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitat	6.2.2.9 - Cormorants Table 6.9	Quote (page 6-92) "Greatand double crestedcormorants both breed inCoastal Newfoundland(see Table 6.9)"ECCC notes that Table 6.9does not includereference to eithercormorant species. Theproponent should revisethe statement to includereferences or shouldrevise Table 6.9 to includeGreat and Double-crestedCormorants to maintainconsistency	ECCC requests that the proponent revise the statement, provided in the previous column, to include reference, or revise Table 6.9 to include both cormorant species maintain consistency.
ECCC-08	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitat	6.2.3.3 - Landbirds	Quote (page 6-97) "Nocturnally migrating species are often attracted to artificial lighting on vessels, especially when fog or	ECCC requests that the proponent update their analysis to include an effects assessment on landbirds which may

	rain sets in after the	be encountered
	night's nocturnal	during project
	migration has begun	activities.
	(Gauthreaux and Belser	
	2006)."	
	As per Gjerdrum et al.	
	2021, in addition to	
	nocturnal seabirds, many	
	landbird species have	
	been reported stranded	
	at coastal and offshore	
	sites in Atlantic Canada	
	during stranded bird	
	surveys.	
	The proponent should	
	update their analysis to	
	include landbird species	
	that may have	
	overlapping ranges with	
	the Project Area to	
	improve the effects	
	assessment of potential	
	impacts on landbirds.	
	Gjerdrum, C., R.A.	
	Ronconi, K.L Turner, and	
	T.E. Hamer. Bird	
	strandings and bright	
	lights at coastal and	
	offshore industrial sites in	
	Atlantic Canada. Avian	
	Conservation & Ecology.	

ECCC-09	5(1)(a)(iii) Migratory Birds	7.1.5 - Species at Risk	6.2.4 - Species at Risk	16(1): 22. https://doi.org/10.5751/A CE-01860-160122 *This IR is related to new research that was published in 2021. Quote (page 6-97) "An additional eight species, while not designated provincially or federally, occur on ICUN's Red List	ECCC requests that the proponent revise Table 6.12 to include Atlantic Puffin, which
				of Threatened Species." ECCC notes that Table 6.12 does not include reference to Atlantic Puffin, which are designated Vulnerable by the IUCN due to declines in the number of birds nesting at European colonies. The proponent should revise Table 6.12 accordingly. Sections 10 and 15 should also be updated according to this correction, as required. It is also not clear what eight species are being referred to in the statement above; there are more than eight species in Table 6.12.	is IUCN Red-listed as Vulnerable. ECCC requests that the proponent subsequently apply the above-mentioned update to Sections 10 and 15, as required.

ECCC-10	5(1)(a)(iii) Migratory Birds	7.1.9.1 - Special	6.2.5 - Summary of Key	A number of issues have	ECCC requests that
		Areas	Areas and Times	been identified in Table	the proponent revise

		1	1		Lai	only be undertaken	

				by facilities that are authorized to undertake such activities.	
ECCC-12	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitat	10.3.1.2 - Mitigation	Quote (page 10-9, bullet 6) "The regional CWS office will be contacted for separation distances and altitudes between helicopters transiting to and from the MODU and migratory bird nesting colonies, as per CWS guidelines (Government of Canada 2018) and routes will comply with provincial Seabird Ecological Reserve Regulations, 2015. Specific dates will be provided in the EPP." ECCC provides the following guidance document for the proponent's consideration "Seabird and waterbird colonies: avoiding disturbance" (URL: https://www.canada.ca/e n/environment-climate- change/services/avoiding -harm-migratory- birds/seabird-waterbird- colonies- disturbance.html). Helicopters should maintain a minimum distance of at least 300	ECCC requests that the proponent include the 300 metre separation distance from seabird colonies for helicopters into the mitigation measures.

		1			I
				metres vertically and	
				horizontally from all areas	
				of an island or colony	
				occupied by seabirds and	
				waterbirds.	
				Additionally, notes that	
				the Regulation Respecting	
				Excluded Physical	
				Activities (Newfoundland	
				and Labrador Offshore	
				Exploratory Wells) s.21	
				includes measures that	
				proponents should	
				implement to avoid	
				harming, killing or	
				disturbing migratory birds	
				including:	
				g. measures that require	
				support helicopters to fly	
				at altitudes greater than	
				300 metres above sea	
				level where there are	
				active migratory bird	
				colonies and at a lateral	
				distance of 1000 metres	
				from Cape St. Francis and	
				Witless Bay Islands	
				Important Bird and	
				Biodiversity Areas.	
ECCC-13	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory	A) 10.3.1.3.1 - Presence	A) Quote (page 10-14)	ECCC requests that
		birds and their	and Operation of the	"Data on the distance	the proponent
		habitat	MODU	at which birds can be	reassess their
			B) 10.3.1.3.4 - Well	affected by light from	conclusion provided in
			Testing and Flaring	a MODU are limited.	

C) 10.3.2.3.1 - Presence and Operation of a MODU	The zone of influence varies with factors such as weather,	the EIS that "the magnitude of the effect of the presence
	intensity and position (height) of the light source, and ambient light conditions (Montevecchi 2006). Bruinzeel and van	and operation of a drilling installation on marine and migratory birds is anticipated to be low, given
	Belle (2010) found that the distance at which birds become disoriented ranges from 200 m in dense	potential impacts/effects on Leach's Storm-petrel and the uncertainty
	fog to 1,000 to 1,400 m in lighter fog to light rain, to up to 4.5 km in overcast skies with no celestial cues	that remains related to the effect and zone of influence of artificial lighting on marine and migratory
	and otherwise good visibility. Poot et al. (2008) showed that 30 kW of electric lighting affects	birds.
	migrating landbirds out to at least 5 km, but greater distances cannot be ruled out (Poot et al. 2008; Hodd at al. 2011;	
	Hedd et al. 2011; Ronconi et al. 2015). Large numbers of fledgling short-tailed shearwaters were	
	attracted to intence, temporary artificial lighting separated by 15 km of sea from	

the nearest nesting
colony (Rodriguez et
al. 2014)."
A) Quote (page 10-15)
"Based on the
information and
analysis summarized
here, and with the
implementation of
appropriate
mitigation measures
as summarized in
10.3.1.2, the overall
magnitude of the
effects of the
presence and
operation of the
MODU on marine
and migratory birds
is anticipated to be
low. There may be a
slight increase in
mortality/injury
levels due to
collisions,
disorientation and
potential predation,
although, based on
previous monitoring,
the mortality rate is
anticipated to be low
as most stranded
birds encountered on
platforms and vessels
are found alive and
released
successfully."
Successiuny.

 B) Quote (page 10-19) "I' required, foring activities would be short in duration (approximately 36 hours per test, if floring occurs of all), and associated bird attraction will be limited to within 15 km of the MODU." (C) Quote (page 10-22) "Given that the likely zone of influence of the Project (conservatively set at 16 km dometer based on Section 10.1.4.1) at one time of location will reprosent a small proportion of the feeding, breeding and region." ky habitats or during important activities of atherwise be affected in a manner that ccuses detectable adverse gifects to overall populations in the region." proponent's conclusion			ECCC disagrees with the	
			proponent's conclusion	

that the overall
magnitude of the effect
of the presence and
operation of a drilling
installation on marine
and migratory birds is
anticipated to be low.
In the absence of
systematic searches and
documentation of
stranded birds (live and
dead) to quantify the
level of attraction and
effect of strandings, and a
discussion of mitigation
measures to reduce the
amount of artificial
lighting, the proponent
cannot state with
certainty that the effect
of the presence of the
MODU will be low in
magnitude.
Considerable uncertainty
remains as to the actual
zone of influence of light
on migratory birds. There
have been no studies
undertaken on the
maximum light detection
distance of the eyes of
migratory birds.
Furthermore, no studies
have been undertaken
that describe how far

		away from a light source	
		a migratory bird must be	
		before light affects its	
		behaviour. This	
		uncertainty should be	
		reflected in the	
		proponent's level of	
		confidence in their	
		conclusions.	
		Leach's Storm-petrels	
		breeding on Baccalieu	
		Island, the largest colony	
		in the world and hosting 4	
		million breeding	
		individuals, travel across	
		and forage in the	
		proposed Project area	
		(deep waters, specifically)	
		during the breeding	
		season, and are known to	
		be attracted to sources of	
		artificial lighting.	
		Therefore, effects on	
		breeding birds,	
		specifically Leach's Storm-	
		petrel, could be high.	
		ECCC recommends that	
		the EIS be revised,	
		considering the	
		uncertainties that remain	
		regarding the level of	
		light attraction, the zone	
		of influence of artificial	
L	1		

				light on migratory birds, and the potential effects on Leach's Storm-petrel populations.	5000
ECCC-14	5(1)(a)(iii) Migratory Birds	7.1.4 - Migratory birds and their habitats	 A) 10.3.1.3.6 - Supply and Servicing B) 15.4.3 - Future Projects and Activities and their Effects Table 15.8 - Marine and Migratory Birds: Residual Effects from Other Projects and Activities in the RAA 	 A) Quote (page 10-20) "Supply vessel traffic for the MODU represents a negligible contribute to the overall vessel traffic off Eastern Newfoundland, and Project-related supply vessel traffic will use existing and established routes where possible." B) Quote (page 15-28, Table 15.8 "Other Ocean Users") "The transitory nature of vessel traffic reduces potential residual effects on marine and migratory birds in any particular location and at any particular time." Given the increased amount of artificial lighting and increased possibility of accidental events from each supply vessel that is associated with the Project, ECCC does not agree with the 	ECCC requests that the proponent revise the EIS to include an analysis and discussion of how support vessels in the Project Area will contribute to the attraction of migratory birds.

				during flaring events, which were both identified as mitigation measures in Section 10.3.1.1	
ECCC-16	5(1)(a)(iii) Migratory Birds	7.6.1 - Effects of accidental events	16.4.1 - Oil Spill Response Plan	Quote (page 16-40) "Suncor has an existing OSRP which will be used to develop a Project- specific OSRP for the exploration drilling program" ECCC notes that Suncor has developed a Wildlife Response Plan for the Terra Nova FPSO (development project), which was reviewed by ECCC in November 2020. The Wildlife Response Plan should be adopted or modified for the current Project to ensure sufficient wildlife response.	ECCC requests that the proponent consider the information from their existing Terra Nova FPSO Wildlife Response Plan for the development of the Wildlife Response Plan for this project.
ECCC-17	5(1)(a)(iii) Migratory Birds	7.6.1 - Effects of accidental effects	16.5.2.1.2 - Potential Effects of Dispersants on Marine and Migratory Birds	Quote (page 16-70) "A study of the effect of dispersant use on feather structure, waterproofing, and buoyancy of common murres show no significant difference between the effects of oil alone and the effects of a mixture of dispersant and oil (Whitmer et al. 2018). In both cases, the effect was dose-dependent and	ECCC requests that the proponent revise the statement, provided in the previous column, to correctly interpret and report the results of Whitmer et al. 2018.

1			
		resolved over two days. A	
		high concentration of	
		dispersant alone caused an immediate, life-	
		threatening loss of	
		waterproofing and	
		buoyancy, which resolved	
		within two days"	
		The proponent has	
		incorrectly interpreted	
		and reported the results	
		of Whitmer et al. 2018.	
		While it is correct that the	
		effect of oil alone and the	
		mixture of dispersant and	
		oil were not significantly	
		different, the study	
		clearly states that the	
		effects <u>did not</u> resolve	
		over time. Whitmer et al.	
		2018 notes "Birds	
		exposed to oil, or	
		dispersant and oil	
		mixture, experienced	
		dose-dependent	
		waterproofing	
		impairment without	
		resolution over two days"	
		and "the impacts of oil	
		and dispersed oil did not	
		<i>improve over time"</i> . It is	
		difficult to compare the	
		results of the Whitmer et	
		al. 2018 study (conducted	
		al. 2010 study (conducted	

				in a laboratory) to what may occur in the offshore areas of NL. Specifically, in Whitmer et al. 2018, post-exposure birds were kept out of the water and in ambient temperatures of 15.5°C-18.3°C, whereas any birds exposed to dispersants in the Project Area would be confined to water in much colder temperatures.	
ECCC-18	5(1)(a)(iii) Migratory Birds	7.6.1 - Effects of accidental events	16.5.2.1.2 - Potential Effects of Dispersants on Marine and Migratory Birds	The proponent's synthesis of the effects of dispersants on marine and migratory birds provides conflating information and does not provide sufficient evidence to support the conclusion that "dispersant mitigates the potential adverse effects of oil on birds compared to untreated oil". While applying dispersants may be beneficial for migratory birds in some situations, they may prove to be more harmful	ECCC requests that the proponent undertake a more thorough and complete analysis of the effects of dispersants on marine and migratory birds, and revise the conclusions accordingly.

		in others; therefore the	
		use of dispersants must	
		be done with careful	
		consideration on a case	
		by case basis. It is also not	
		known what the impacts	
		of dispersants alone may	
		have on birds, and in	
		particular on their	
		plumage; dispersants are	
		a surfactant and	
		therefore may	
		compromise the	
		waterproofing of	
		feathers, in a similar	
		manner to that of oil.	

ANNEX 3: Advice to the proponent

ID	Reference to EIS	Context and Rationale	Advice to the Proponent
ECCC-19	7.1.4 - Migratory birds and their habitats	As per the Regulations Respecting Excluded Physical Activities (Newfoundland and Labrador Offshore Exploratory Drilling Wells) Condition 7b, monitoring is required from the drilling installation and support vessels throughout the day for the presence of stranded migratory birds. Systematic deck searches for stranded birds undertaken by trained observers are more effective as mitigation than opportunistic searches. These systematic searches should occur at least daily (preferably at dawn), with search efforts documented and observations recorded (including notes of efforts when no birds are found). ECCC has expertise in this area and is available to be consulted in the development of systematic monitoring protocols.	 ECCC-CWS has developed new guidance to assist operators with the development of site-specific protocols for systematic stranded bird surveys. ECCC-CWS Guidance for Developing Systematic Stranded Bird Survey Protocols for Vessels and Platforms has been attached for the proponent's consideration. a) ECCC-CWS Guidance for developing systematic stranded bird survey protocols for vessels and platforms b) Appendix 1 – Stranded Bird Encounter Datasheet (fillable PDF – superseded by Excel datasheet) c) Appendix 2 – Infographic and Reference Card – What to do when you find a stranded bird? d) Appendix 3 – Seabird Identification Photo Card e) Procedures for handling and documenting stranded birds encountered on infrastructure offshore Atlantic Canada f) NEW – Microsoft Excel fillable datasheet for stranded bird data (required)
ECCC-20	General Comment	ECCC has developed a pelagic seabird monitoring protocol called the Eastern Canada Seabirds at Sea (ECSAS) program,	ECCC advises that the proponent employ the use of the new mobile ECSAS database for survey data collection.

Table 3: Additional advice to the proponent, such as guidance or standard advice related to your departmental mandate

that is recommended for use by	
experienced observers for all offshore	
projects and is available at	
http://publications.gc.ca/site/eng/389623/	
publication.html for the proponent's	
consideration.	
Bird distribution data should be collected	
during proposed activities. To verify the	
effects predictions, a data collection effort	
should be designed in consultation with	
ECCC and be carried out by an individual	
who is appropriately trained and dedicated	
to recording marine bird observations.	
ECCC can provide training in ECSAS.	
In an effort to facilitate the collation of	
survey data from various outside sources,	
ECCC has developed a new mobile ECSAS	
database that will permit the collection of	
data in a standard format. This new mobile	
database should be used by the proponent	
to facilitate data collection and storage. A	
User's Guide has been developed to assist	
the proponent in the use of this tool and	
can be obtained from ECCC upon request.	
In an effort to expedite the process of data	
exchange, ECCC would appreciate that the	
data (as it relates to migratory birds and/or	
species at risk) collected from these	
baseline surveys be forwarded in digital	
format to our office following the	
completion of the study at:	
Environment and Climate Change Canada	
(C/O Environmental Assessment)	
6 Bruce Street	
Mount Pearl, NL	
A1N 4T3	

		These data will be centralized for our internal use to help ensure that best possible natural resources management decisions are made for these species in Atlantic Region. Metadata will be retained to identify source data and will not be used for the purpose of publication. ECCC will not copy, distribute, loan, lease, sell or use this data as part of a value-added product or otherwise make the data available to any other party without the prior express written consent of the proponent.	
ECCC-21	16.4 - Contingency Planning and Spill Response	All emergency incidents can potentially affect wildlife. During these incidents ECCC acts as a Resource Agency, which sets wildlife emergency response standards and guidelines related to Migratory Birds and Species at Risk under its jurisdiction. As such, Wildlife Response requires a Wildlife Emergency Response Plan (WERP), which is a component of the Incident Command System (ICS) for pollution incidents affecting wildlife, and should address all of the various procedures and strategies required to mount an effective wildlife response. At minimum, a WERP must include the following information: 1. Information on the wildlife potentially at risk in the area; 2. Mitigation measure to deter non- affected areas; 3. Mitigation and response measures to be undertaken if wildlife and/or sensitive habitats become contaminated by the incident (including treatment of oil-affected wildlife), and	The proponent should consult ECCC when developing Wildlife Emergency Response Plans (WERPs). ECCC is available to review WERPs prior to their implementation. Even during an emergency situation, it is also important to note that permits issued by ECCC may be required prior to deterring or relocating Migratory Birds and/or Species at Risk. Guidance materials including "Guidelines for Developing Wildlife Response Plans" (ECCC, 2022) are available online at <u>National</u> <u>Wildlife Emergency Response Framework - Canada.ca</u>

The type and extent of wildlife monitoring that would conducted during and following a pollution incident.
