

To whom it may concern:

↓ listened to your broadcast and when I stated it was not well advertised with only 7 people listening I think that explains my concern. My no 1-800 # to call when it is a government survey? I have questions I feel are important for all people.

① Who owns land at the site? (Who owns water, (Federal Government) as it was declared a lake years ago. ② It has been stated it would be underground water from site to hydro towers, that is rock for most of distance; so it would be like fracking. What happens to wells for farms and homes? It has also been stated this calls would be in cement, cement is a conductor of electricity, as what about stray voltage?

This site in Marmora is less than 4 km from former Deloro mine site. The cost for clean-up and damage done was very costly at taxpayers expense. There are two things we can't make, that is land + water we need to protect both.

There are many town homes in area since mine closed; how are they going to affect water? How ponds have a life of about 20 years with pump decrease each year, at the end of this who will be responsible for clean-up? There could also get damaged due to storms etc, who is going to be responsible?

This project will create jobs for this area but at what cost? What might this municipality be left with? When finished how many jobs will there be? This is spring fed very cold what are we destroying? The residence how do we more construction, only one town hall meeting, that was in 2010.

When mine was in operation there was alot of sulphur problems, by tons.

There are many who are who dealing with an abandon mine - Who is responsible for cleaning up existing contamination at this site? What is cost, to whom? I ask what are the long term benefits for this community, because the adverse impacts?

Maureen Kelly.
